

INSURANCE AUTOMATION – USE CASE

Insurance companies that are geographically distributed use multiple ERPs to store and process their invoices, claims documents and other important financial documents. Zura leverages advanced automation capabilities, data ingestion and data extraction techniques to aggregate data from multiple formats (excel sheets, images, Pdfs) . In addition, we use business rules driven validation techniques to generate uniform output formats that can be pushed to any external ERP system.

Zura also offers point solutions to Insurance companies where , by using advanced automation techniques, documents generated by their external systems need to be validated and pushed back to their ERP systems.
